

# FV<sup>3</sup> at the Hazardous Weather Testbed

Lucas Harris, S-J Lin, Matt Morin,  
and the GFDL FV<sup>3</sup> team

Special thanks to Ming Xue,  
Tim Supinie, and Bill Putman

# FV<sup>3</sup> Development Update

**Development never sleeps. Keep moving forward!**

Work continues on fvGFS physics (especially GFDL microphysics) and on modifying advection operators and dissipation mechanisms.

Same FV<sup>3</sup> dynamical core in fvGFS and NCEP FV3GFS as in GFDL AM4 climate/S2S model. **Unification in progress!**

Space weather & deep atmosphere development is beginning

Moving nested grids for hurricane prediction

Beginning development of stand-alone regional model with EMC, for university users and others with limited computing capacity

# Community involvement, from day 1

Collaborating with OU-CAPS on convection-resolving model development.  
Submitted fvGFS-CAPS to HWT using Thompson MP

Examination of a **very** early “**version 0**” of FV<sup>3</sup>-powered CRM at HWT.  
Get feedback from expert severe-weather forecasters and researchers from the very beginning.

Open invitation for interested parties to visit GFDL to work on fvGFS and other model development efforts. EMC has already committed three developers to visit GFDL; OU, Penn State, and AOML visitors also to come.

# fvGFS Design and setup

fvGFS = FV<sup>3</sup> + GFS Physics + NOAH land model

13-km global and 13 & 3-km CONUS nest

Replaces GFS Zhao-Carr with  
six-category GFDL microphysics

Uses IPDv4 designed at GFDL:  
Prepared for future physics upgrades!

Model cold-started from GFS analyses.  
**No** regional initialization yet.

# fvGFS Design and setup

**fvGFS = FV<sup>3</sup> + GFS Physics + NOAH land model**

Nested-grid uses neither shallow nor deep convection (unless noted)

Global grid uses scale-aware SAS

GFS PBL mixing artificially halved and inversion mixing disabled.

Still too much mixing? Work in progress.

~19 minutes/day 3456 PEs on Gaea-c4,  
slightly more on xJet

Post-processed GRIB data at HWT by 09Z

# fvGFS Development Strategy

13-km fvGFS has excellent global skill and shows regional improvements.

Global-to-regional refinement avoids limitations of limited-area models.

**No lateral BCs from another model!**

Nesting allows us to use physics with global skill in global domain, and physics with regional skill in **targeted** regional domain.

**Goal:** Maintain large-scale skill while adding storm-scale information on 3-km nest

***Can we get good qualitative skill for all seasons as well as useful qualitative storm-scale information??***

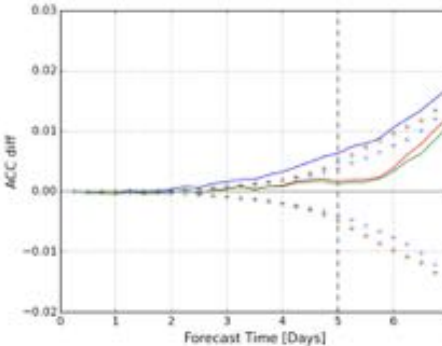

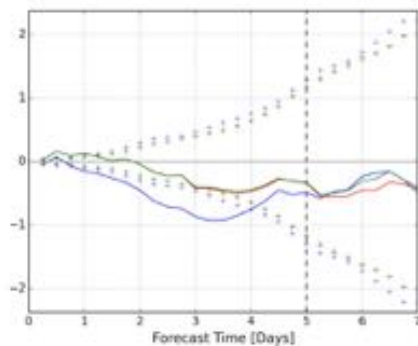

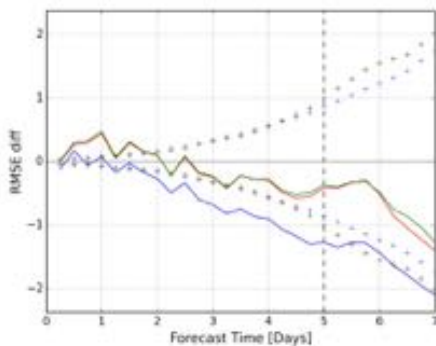

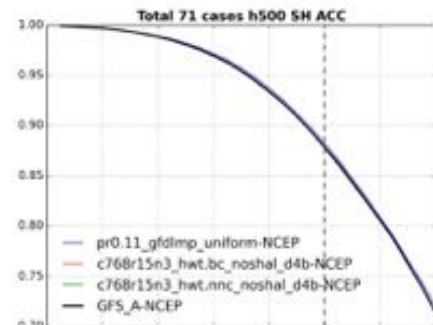

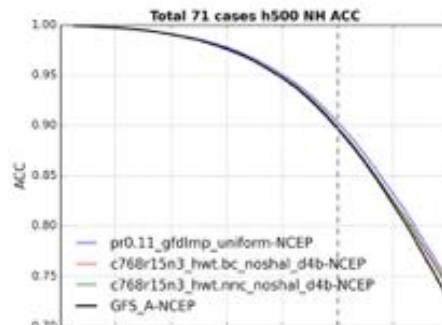

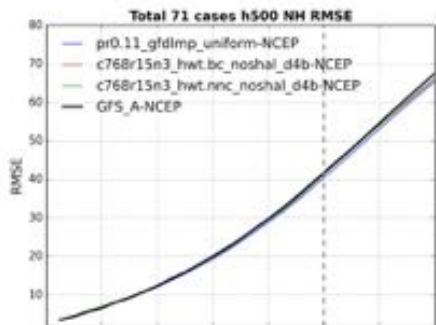

# Objective Skill Scores

Thanks to Shannon Rees, Bill Stern,  
Linjiong Zhou, and Xi Chen

# Updraft Helicity in $FV^3$

$FV^3$  design is *optimal* for representing Updraft Helicity

**Vertical vorticity** and **vertical wind** are co-located  
as “vertically Lagrangian” Finite-Volume mean

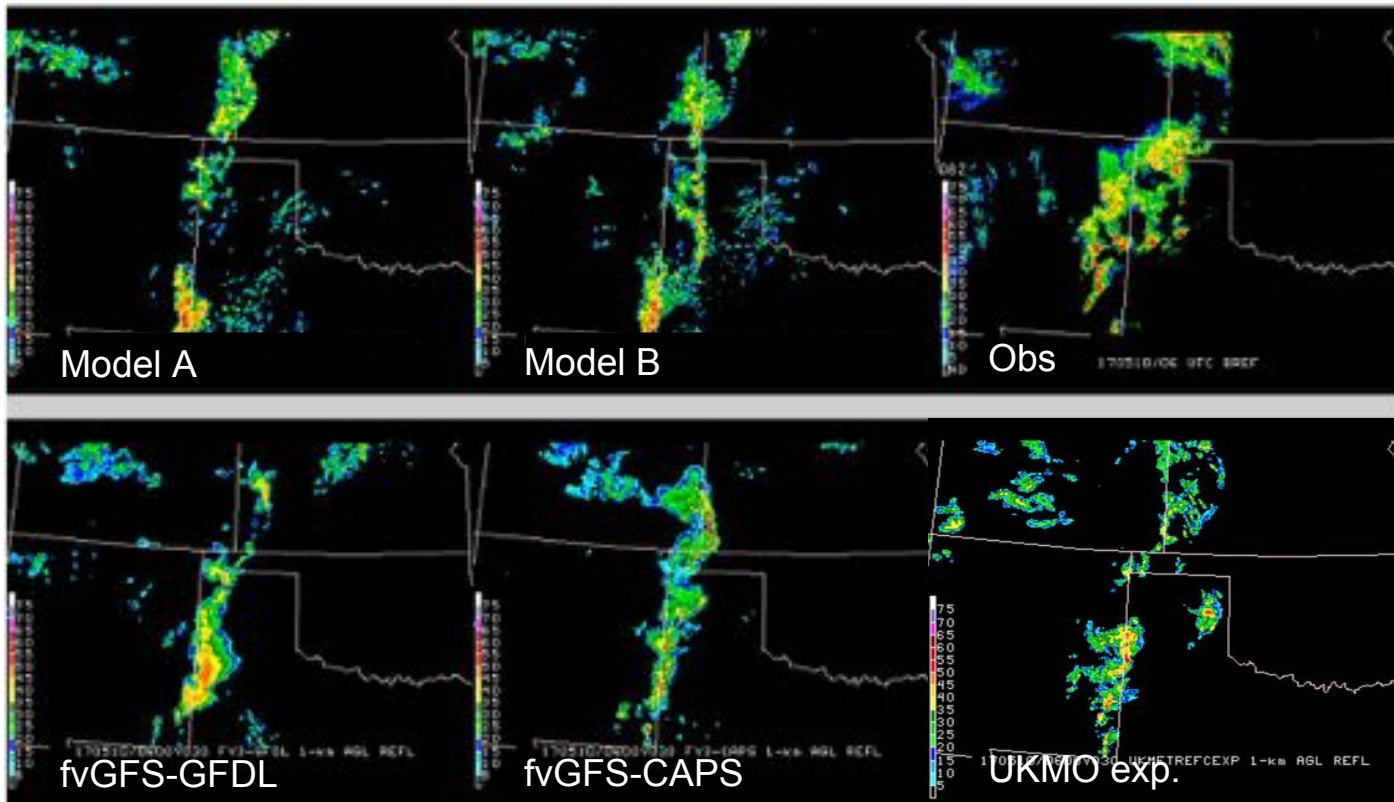

*The Lagrangian control-volume is bounded vertically by Lagrangian surfaces*

*Vertical wind is defined as volume-mean with edge values computed by a conservative cubic-spline reconstruction*

*Vertical component of vorticity is also volume-mean by Stokes' theorem*

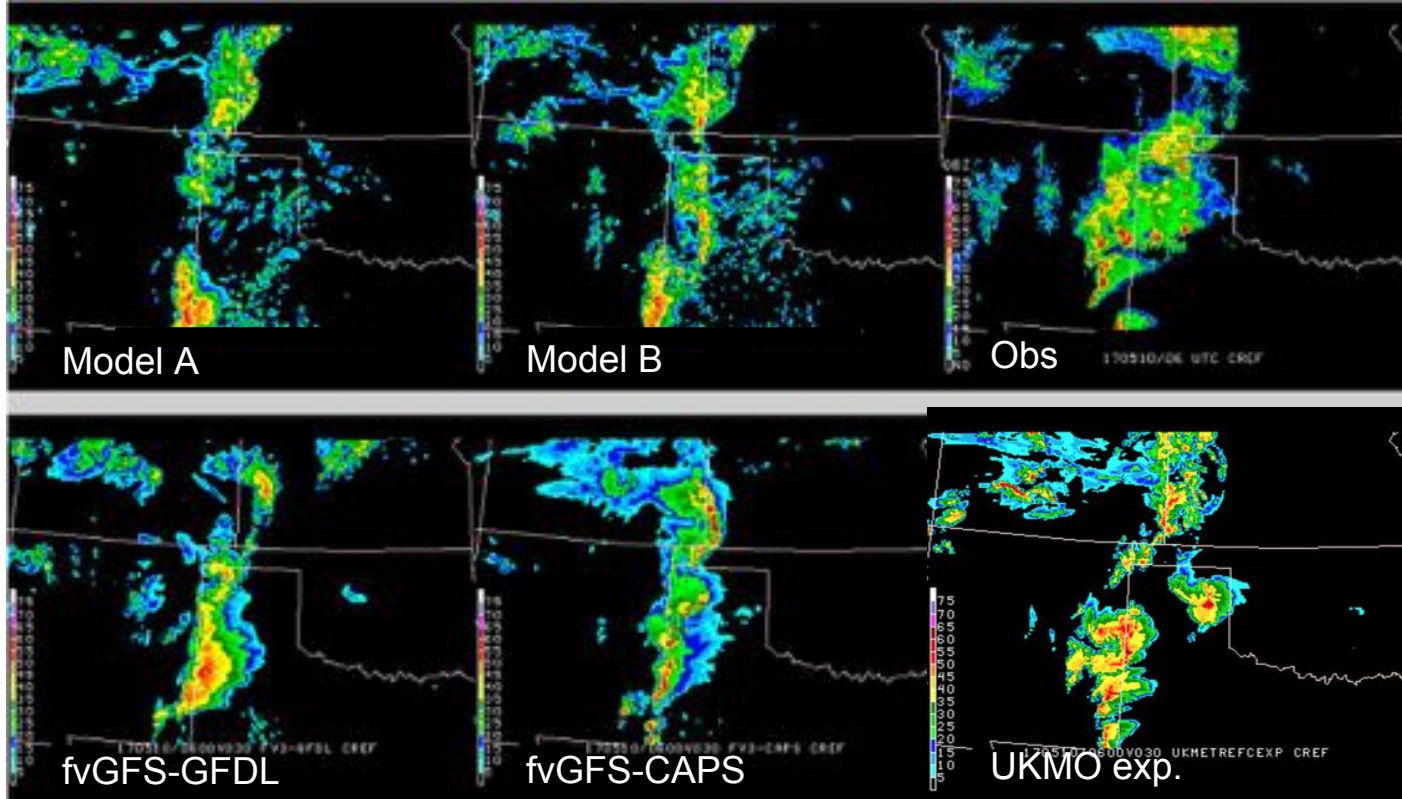

# Base Reflectivity

+30 hr, init 00z 0509

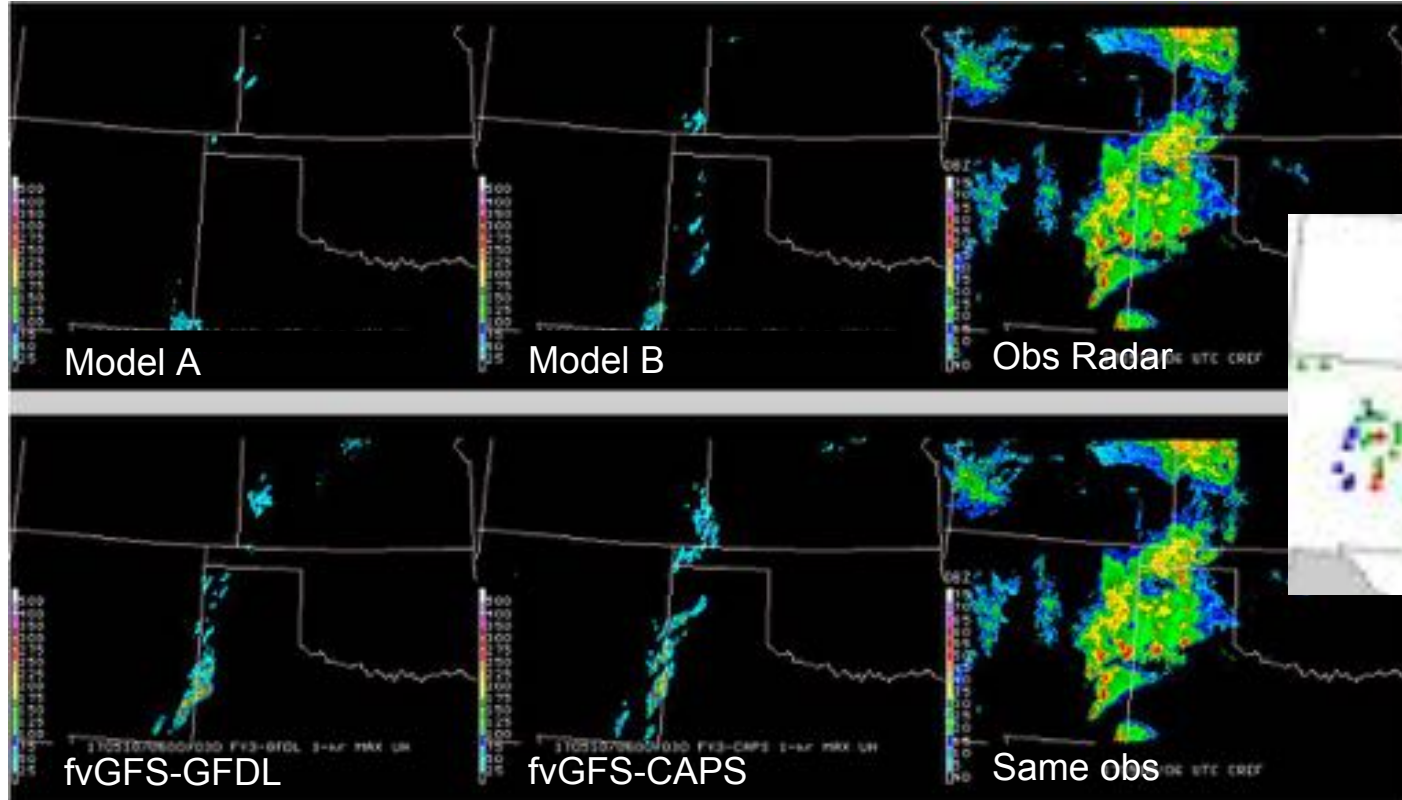

# Composite reflectivity

+30 hr, init 00z 0509

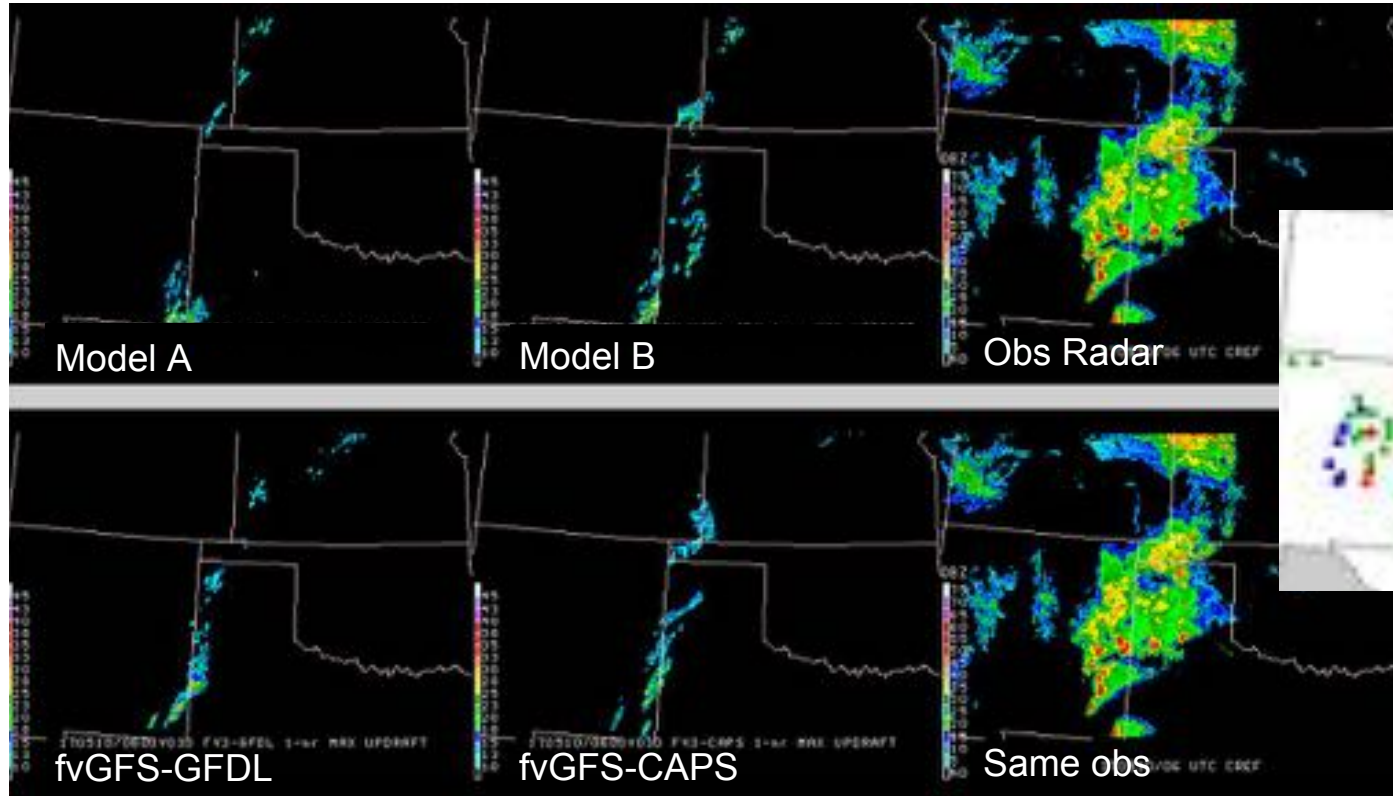

# Hourly-max 2–5 km Updraft Helicity

+30 hr, init 00z 0509

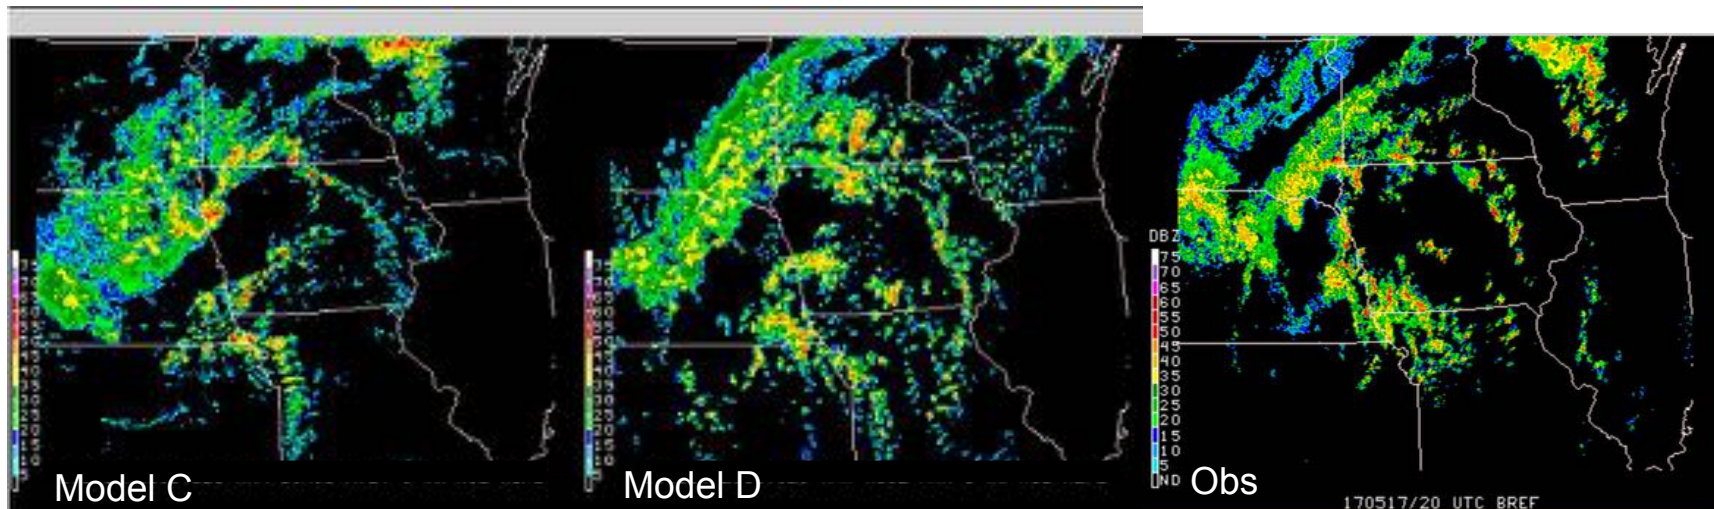

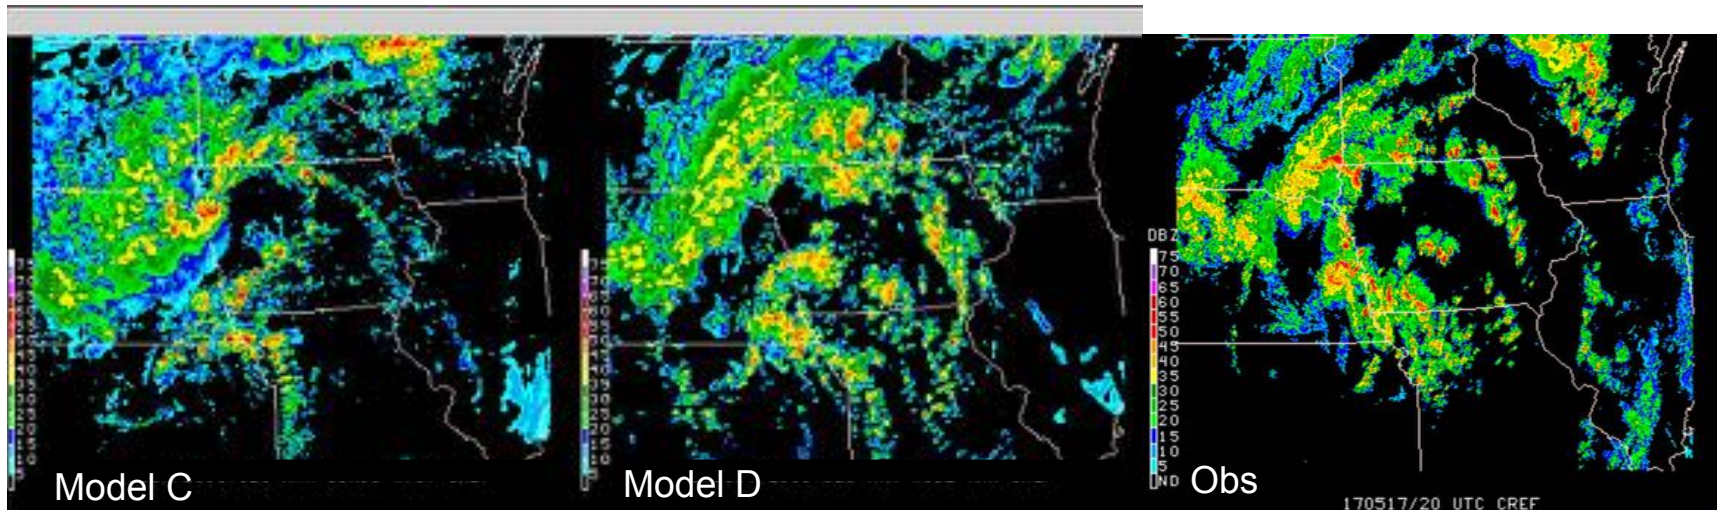

# Hourly- and column-maximum updraft +30 hr, init 00z 0509

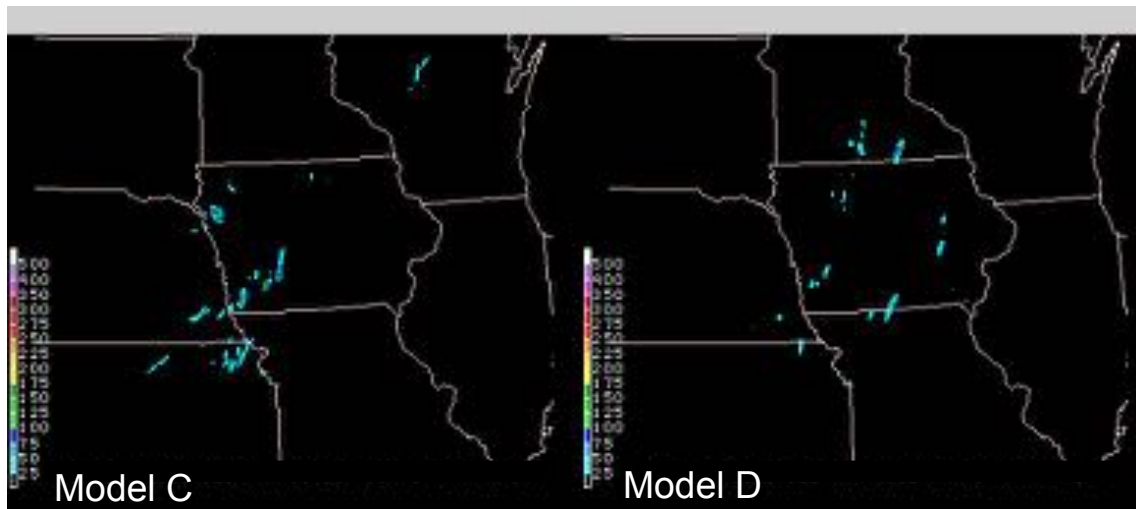

Base Refl. +20 hr init 00z 0517

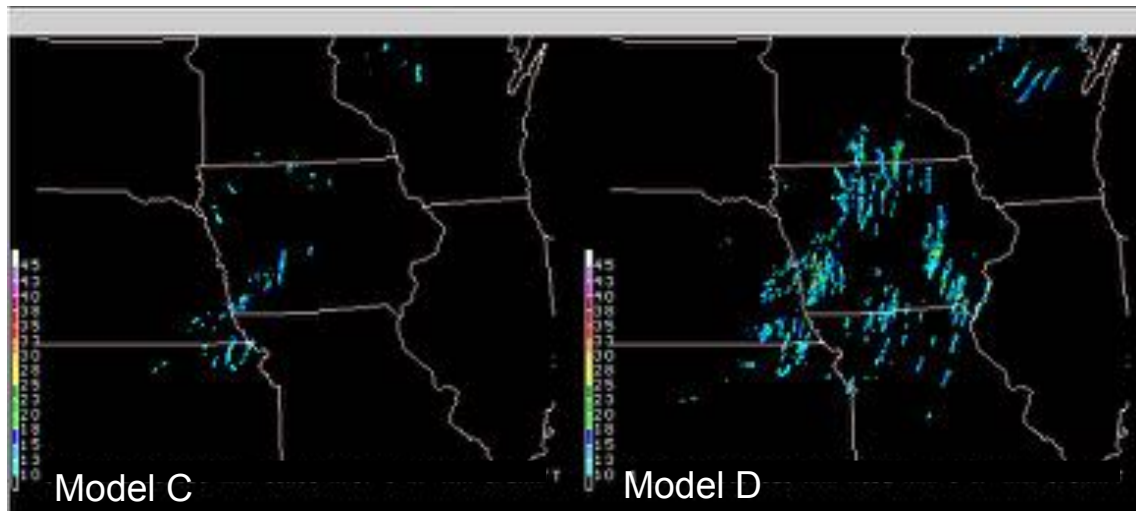

Composite Refl. +20 hr init 00z 0517

Hourly max 2–5 km UH +20 hr init 00z 0517

Hourly max 2–5 km updraft +20 hr init 00z 0517

# Base Reflectivity

+26 hr, init 00z 0613

# Composite Reflectivity

# Hour-max 2–5 km UH

+26 hr, init 00z 0613

# Hour-max updraft

+26 hr, init 00z 0613

GFDL MP: reflectivities are biased low.

But precipitation rate, UH, and updraft velocity are not.

# Towards a global-to-regional CRM

Building community collaborations: EMC, OU, AOML, NASA, and Penn State

Better PBL scheme a **must**; the GFS PBL is suboptimal for CONUS.

CAPS is implementing YSU PBL.

Thompson MP (fvGFS-CAPS) has beautiful, intense cores!

GFDL MP yields good stratiform regions but intensities need improving

Initialization: Radar & satellite DA work proposed by OU and Penn State for 2018

→ fvGFS is a drastically new regional-global modeling system, which may require a drastically new DA strategy (**NoRUC**, a **Nest-only Rapid Update Cycle**)

# Naive proposal for rapidly-updating multiple-cadence unified DA

All runs are unified two-way global-to-regional with at least one (CONUS) nest—both global and regional models stand to benefit

:00—:05 : Assimilate US radar (and satellite) in fvGFS once available  
Begin nowcast-timescale global-to-CONUS-to-WoF run(s)

:05—:15 : Assimilate global satellite and surface obs data once available  
Begin SREF/HREF-length global-to-CONUS runs

:15—:60 : Assimilate remaining slow global surface and radiosonde data  
Begin medium-range/extended-range run

# Towards new global *and* regional thinking

FV<sup>3</sup>'s variable-resolution capabilities creates possibilities for powerful new modeling techniques, and new challenges.

Global-to-regional unified/seamless modeling has great promise for extended-range explicit prediction of extreme weather, especially hurricanes

*We must not be constrained to current limited-area thinking.* We must take advantage of these new capabilities if US modeling is to be second-to-none.

How to design a model that does best at all scales?

Even at 3 km, global models raise problems not faced by CONUS modeling.

**Think outside of the (limited-area) box.**

# Summary

“Suitability” of FV<sup>3</sup> for convective-scale forecasts has been demonstrated.

Global-to-regional 2-way nesting maintains global skill while providing mesoscale and storm-scale detail

Current FV<sup>3</sup>-based CRM is still primitive. Much much more work needs to be done, especially on the **physics** (cloud MP and PBL) and **DA** -- **these are areas where the community can make great contributions!**

fvGFS shown to mimic a regional model, using a refined global grid. This removes the need for BCs and is more efficient than some operational regional models

Unified model approach: systematic year-round evaluation will be crucial. **Cannot tune for just one season for only one type of events.** Must also consider TCs, winter storms, floods, etc.
