

New Generation Atmospheric Model AM4.0 Simulation Characteristics with Prescribed SSTs

**Presented by
Ming Zhao**

GFDL MDT Atmospheric Working Group

Geophysical Fluid Dynamics Laboratory Fall Science Symposium
November 2, 2017

Key changes in AM4

- **Dynamic core:** hydrostatic FV³, high-order divergence damping & model-top sponge layer
- **Aerosols and chemistry:**
 - Full chemistry: 100km/49L 1Pa top + 17 aerosols + 82 gas tracers, interactive O₃
 - Light chemistry: 100km/33L 1hPa top + 17 aerosols + 4 gas tracers, prescribed O₃
- **Radiation:** substantial recent updates
 - 10 μ m CO₂ + WV continuum + refitting to LBL spectroscopy + reduced SW time-step
- **Mountain gravity wave drag:** new formulation based on Garner (2005)
- **Moist convection:** new double plume scheme developed based on UWShCu
- **Aerosol-cloud interactions:** significant modifications from AM3
 - Activation scheme (macro and micro) + convective rain and snow wet deposition
- **Surface fluxes:** new ocean roughness formulation based on COARE3.5
- Large-scale clouds, cloud microphysics, PBL, and non-orographic gravity wave drag are the same as in AM3 except with some parameter retuning

AM4.0 simulations with prescribed SSTs and sea-ice

- Short AMIP runs (1980-2014): 5 members
- Long AMIP runs (1870-2014): 3 members
runs with individual forcing agents on and off → forcing
- Climatological runs: climatological SSTs and sea-ice
prescribed PD or PI forcing agents → forcing
2K SST warming → feedbacks and Cess sensitivity
- Boundary condition and atmospheric forcing agents:
CMIP6 specification of SSTs, sea-ice, solar irradiances, volcanos,
GHG and aerosol emissions
- LM4.0 land model: static present-day vegetation and land use

AM4.0 documentation papers (submitted to JAMES)

AM4.0 bias in annual mean TOA SW radiation comparison with AM2.1 AM3 and CMIP5 models (W/m²)

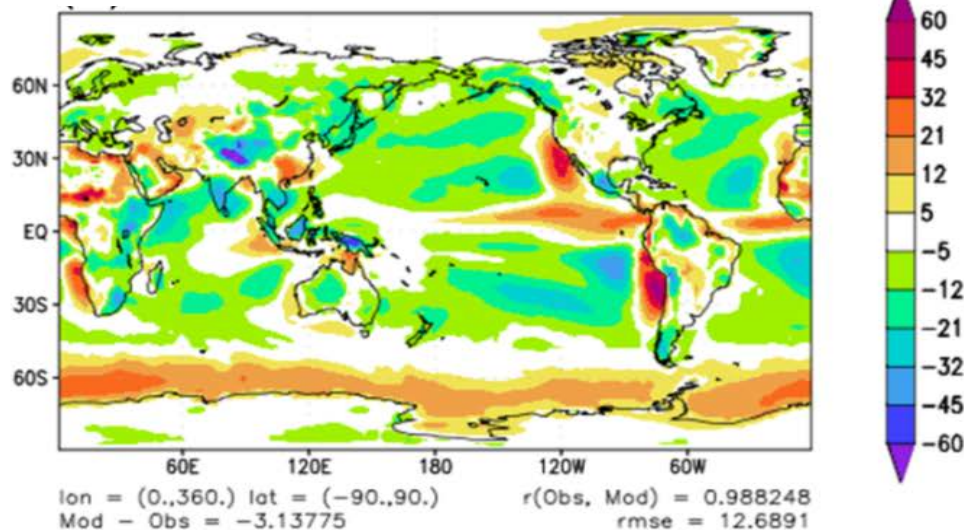

AM4.0 – CERESv2.8 (RMSE:7.6)

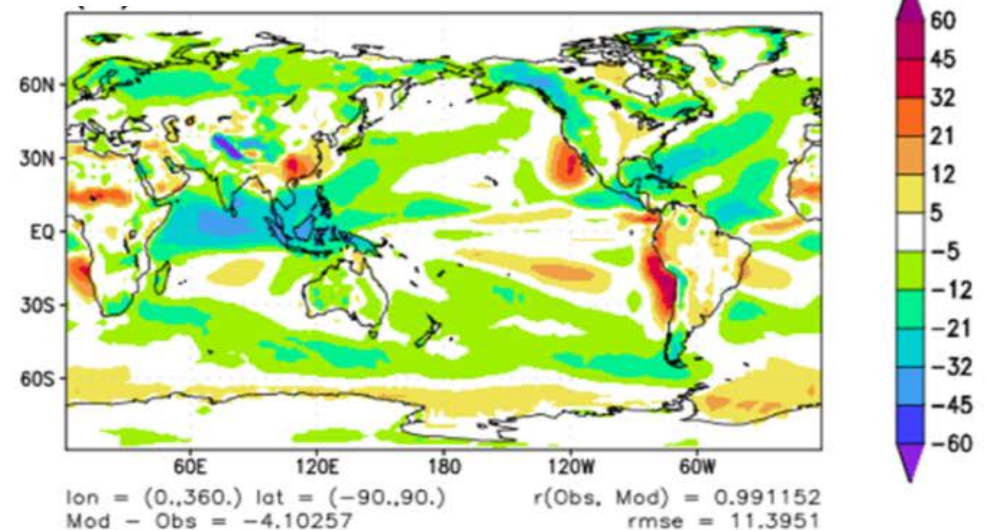

Comparison with CMIP5 models

AM2.1 – CERESv2.8 (RMSE:12.7)

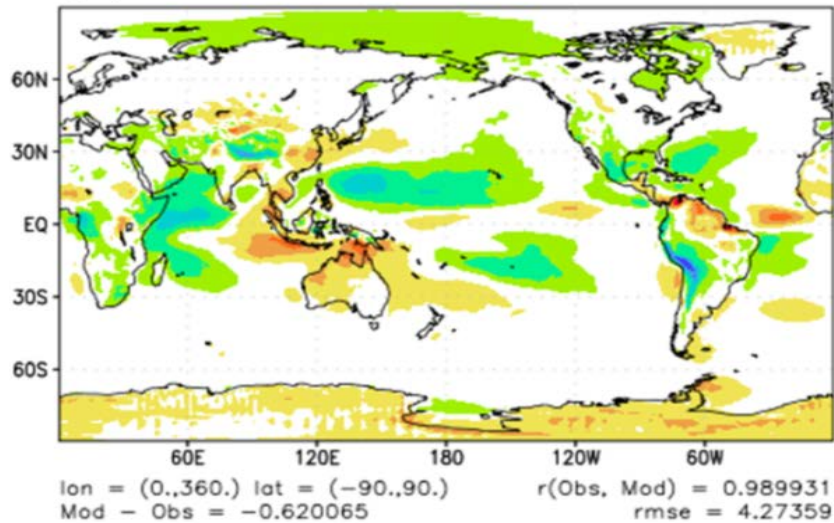

AM3 – CERESv2.8 (RMSE:11.4)

AM4.0 bias in annual mean OLR comparison with AM2.1 AM3 and CMIP5 models (W/m²)

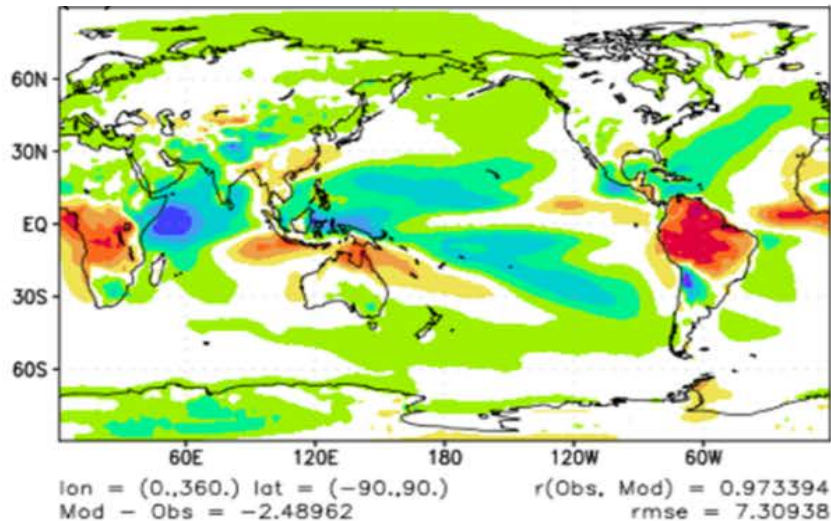

AM4.0 – CERESv2.8 (RMSE:4.3)

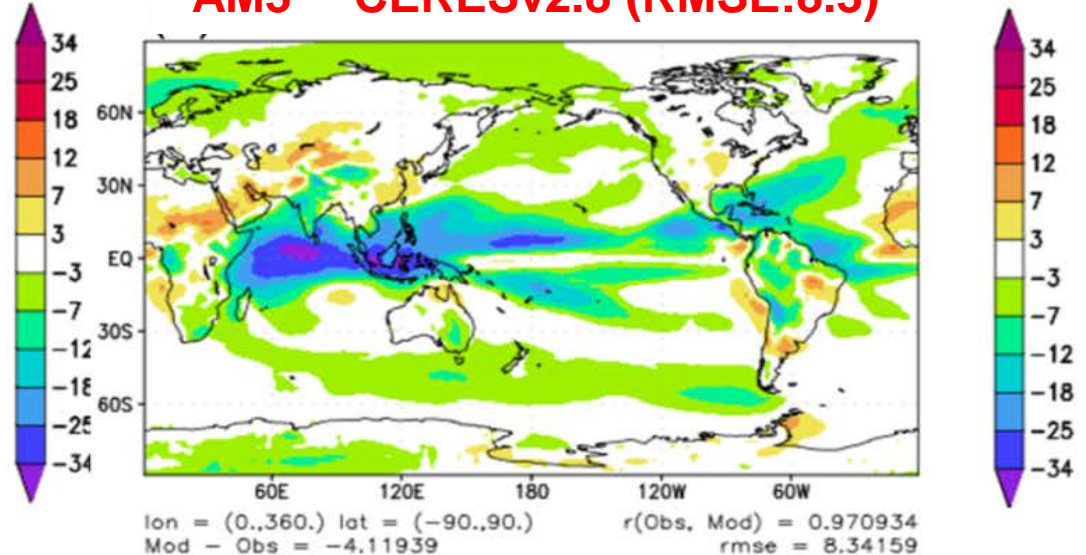

Comparison with CMIP5 models

AM2.1 – CERESv2.8 (RMSE:7.3)

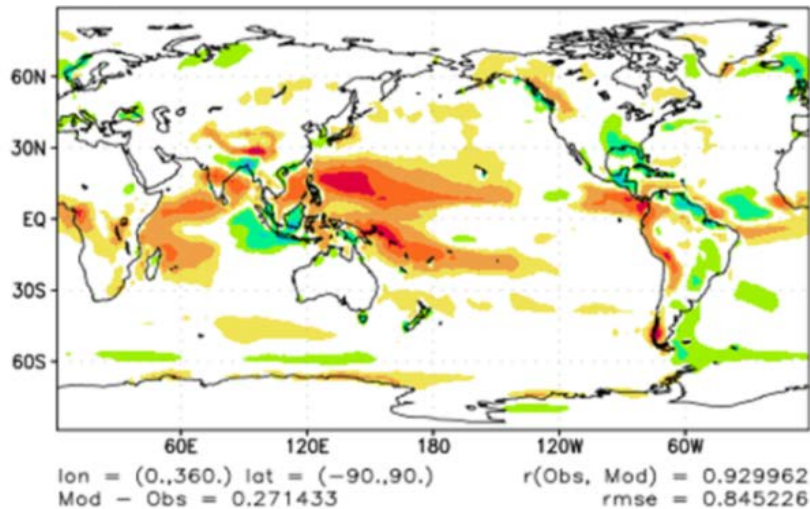

AM3 – CERESv2.8 (RMSE:8.3)

AM4.0 bias in annual mean precipitation comparison with AM2.1 AM3 and CMIP5 models (mm/day)

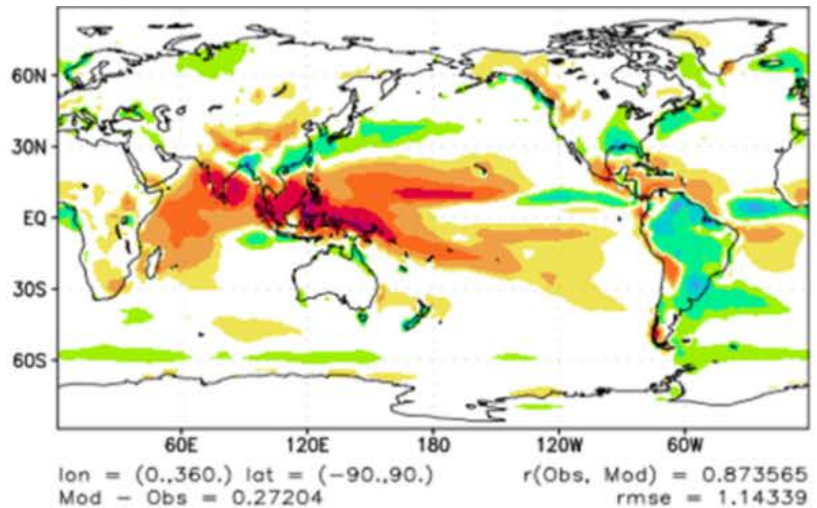

AM4.0 – GPCPv2.3 (RMSE:0.84)

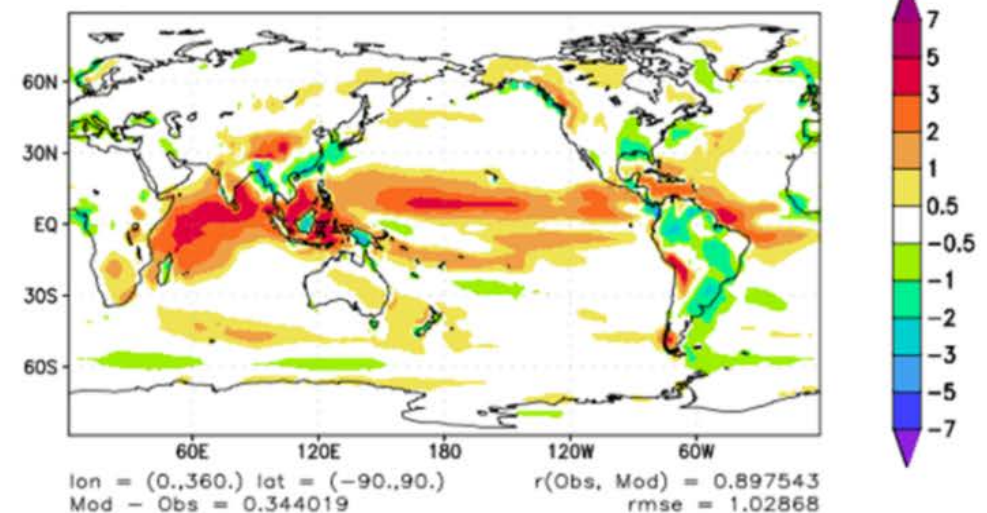

Comparison with CMIP5 models

AM2.1 – GPCPv2.3 (RMSE:1.14)

AM3 – GPCPv2.3 (RMSE:1.03)

AM4.0 bias in zonal mean zonal wind and zonal mean temperature (comparison with AM2.1 and AM3)

Annual mean zonal mean zonal wind

AM4.0 — INTERIM (RMSE:0.76)

AM3 — INTERIM (RMSE:1.52)

AM2.1 — INTERIM (RMSE:1.52) (m/s)

Annual mean zonal mean temperature

AM4.0 — INTERIM (RMSE:0.96)

AM3 — INTERIM (RMSE:1.05)

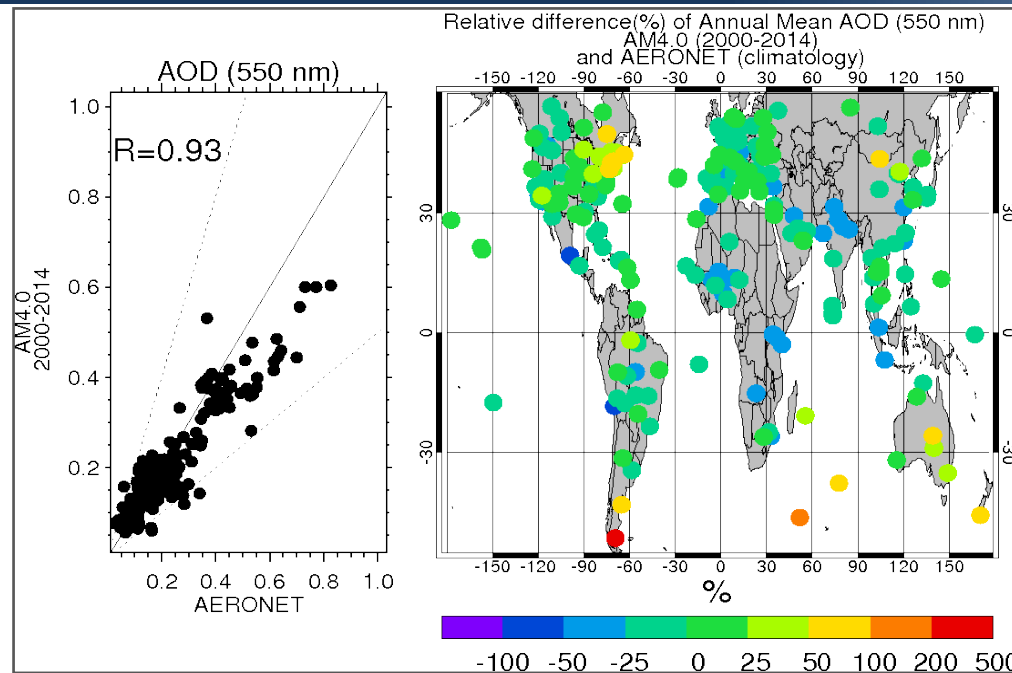

AM2.1 — INTERIM (RMSE:1.87) (K)

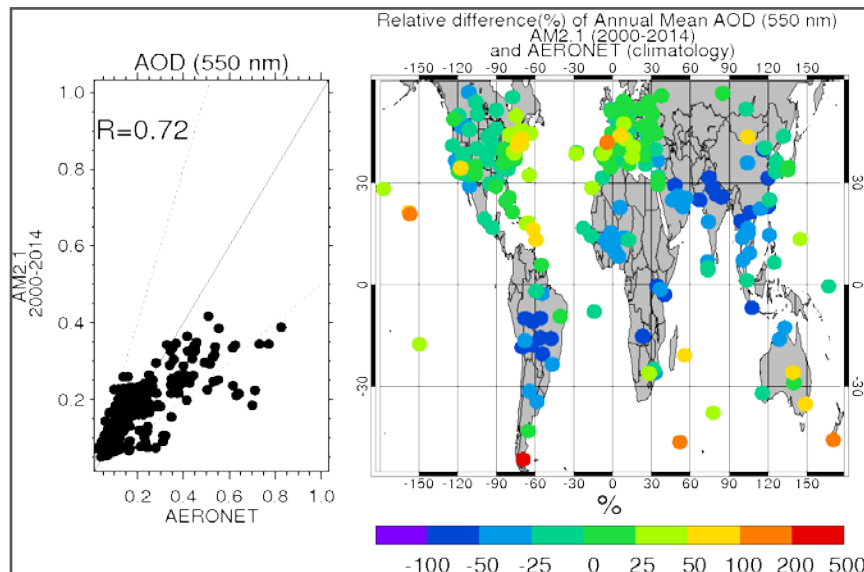

AM4.0 bias in simulated aerosol optical depth comparison with AM2.1 and AM3 (OBS: AERONET)

**AM4.0-vs-OBS
correlation=0.93**

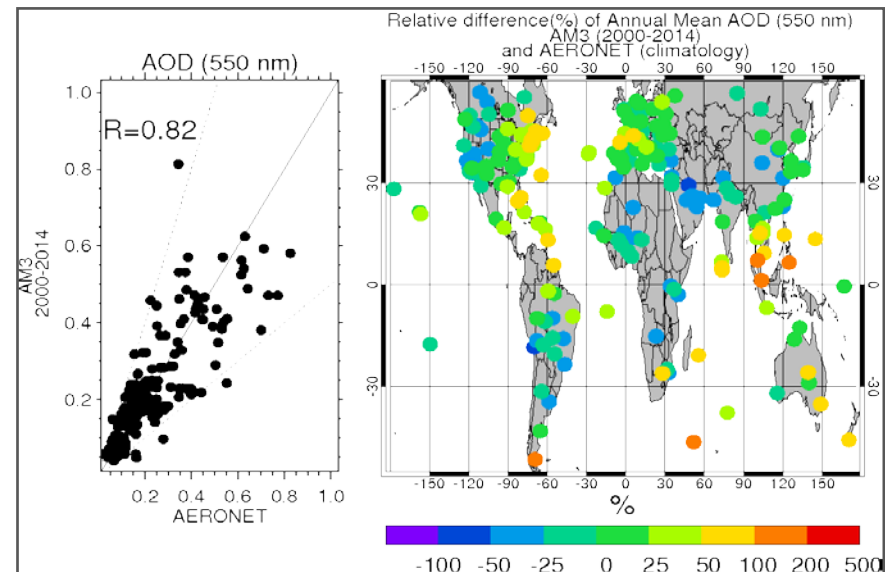

**Color:
percent error
compared to
AERONET**

**AM2.1-vs-OBS
correlation=0.72**

**AM3-vs-OBS
correlation=0.82**

AM4.0 bias in surface wind stress response to NINO3 SST anomalies - comparison with AM2.1 and AM3 (mPa/K)

OBS: ERA-INTERIM (1980-2014)

AM2.1 — OBS (RMSE=3.1)

AM4.0 — OBS (RMSE=2.3)

AM3 — OBS (RMSE=2.8)

AM4/CM4 simulated eastward propagation of MJO (Lag-Longitude-Diagram; winter season)

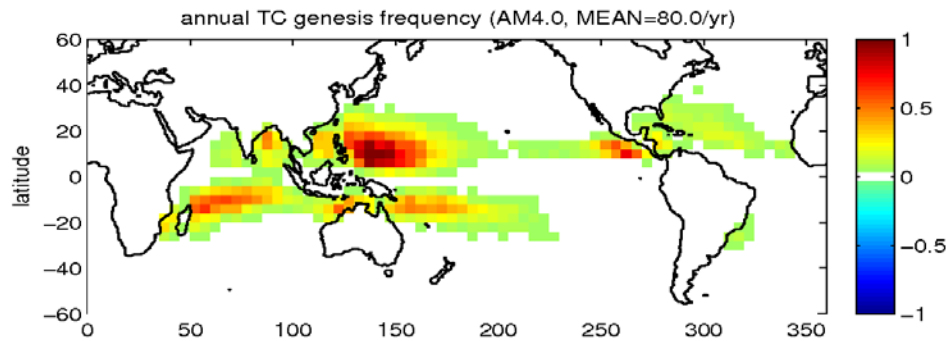

**Lag correlation between
central Indian ocean OLR
and associated near
equatorial OLR at all
longitudes**

AM4.0 simulated geographical distribution of tropical cyclone frequency and its seasonal cycle

AM4.0 annual TC genesis frequency

OBS: IBTRAC

AM4.0 minus IBTRAC

AM4.0 seasonal cycle of TC genesis frequency

AM4.0 simulated change in TOA net radiative flux F in response to changes in GHG, aerosol emissions and global mean SST

Total RFP	= $F\{\text{GHG(PD), Aero(PD), ..., SST(PD)}\}$	- $F\{\text{GHG(PI), Aero(PI), ..., SST(PD)}\}$
Aerosol RFP	= $F\{\text{GHG(PI), Aero(PD), ..., SST(PD)}\}$	- $F\{\text{GHG(PI), Aero(PI), ..., SST(PD)}\}$
GHG RFP	= $F\{\text{GHG(PD), Aero(PI), ..., SST(PD)}\}$	- $F\{\text{GHG(PI), Aero(PI), ..., SST(PD)}\}$
Residual	= Total RFP - Aerosol RFP - GHG RFP	
P2K	= $F\{\text{GHG(PD), Aero(PD), ..., SST(PD)+2K}\}$	- $F\{\text{GHG(PD), Aero(PD), ..., SST(PD)}\}$

Comparison of AM4.0 aerosol RFP with AM3 in long AMIP simulations: $AM4 \approx 0.72 \times AM3$ before 1990

$$\text{Aerosol RFP}(t) = F\{\text{GHG(PI), Aero}(t), \dots, \text{SST}(t)\} - F\{\text{GHG(PI), Aero(PI),} \dots, \text{SST}(t)\}$$

Summary

- **AM4.0 has an improved horizontal resolution, a new convection and mountain drag parameterization with radiative transfer, aerosol-cloud interactions significantly updated. AM4 predicts aerosols from emissions with two options in complexity of chemistry.**
- **AM4.0 forced by observed SSTs produces superior quality than most CMIP5 models in simulations of TOA radiative fluxes, clouds, and precipitation. It also improves simulations of aerosols, MJO, TC statistics, and response to ENSO SSTA compared to AM3/AM2.**
- **Compared to AM3, AM4.0 has a lower Cess sensitivity and a lower aerosol RFP, which should help coupled simulation of historical temperature trend.**
