

# Seamless Predictions and Projections of the Earth's Climate System

Presented by Thomas L. Delworth

Geophysical Fluid Dynamics Laboratory Review

October 29-31, 2019

# Why seamless?

- Earth's climate system is highly interconnected across time and space scales
- Successful prediction of phenomena on shorter time scale may increase confidence in projected response to radiative forcing changes on longer time scales – and vice-versa

## Examples:

- Successful seasonal hurricane predictions used to assess the role of radiative forcing changes
- Decadal predictability of the ocean can shed light on interpreting observed ocean changes under climate change

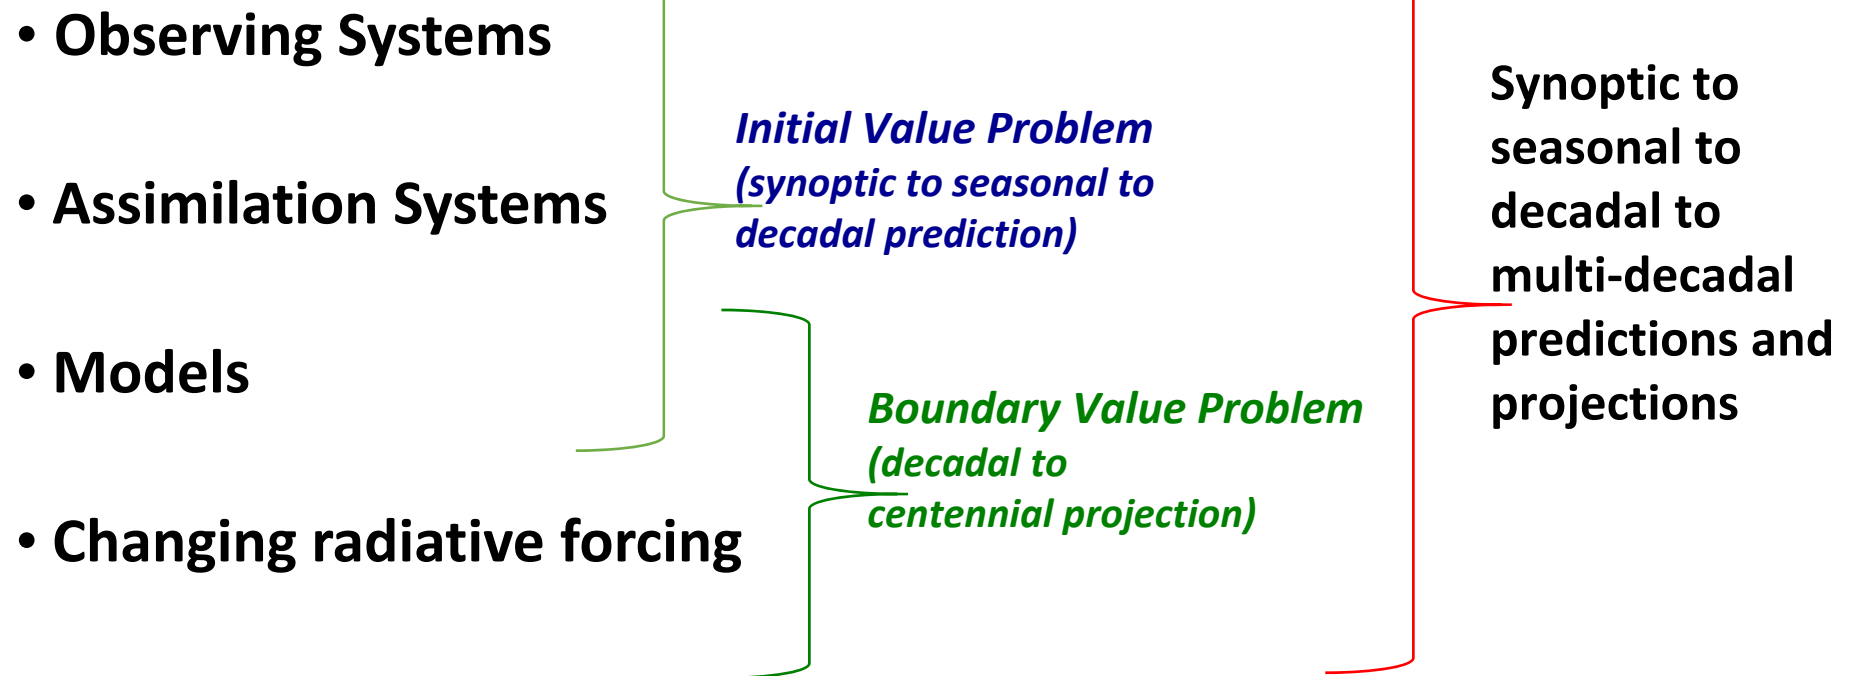

Consistent with OAR Mission:

*“Conduct research to understand and predict the Earth system; develop technology to improve NOAA science, service, and stewardship; and transition the results so they are useful to society.”*

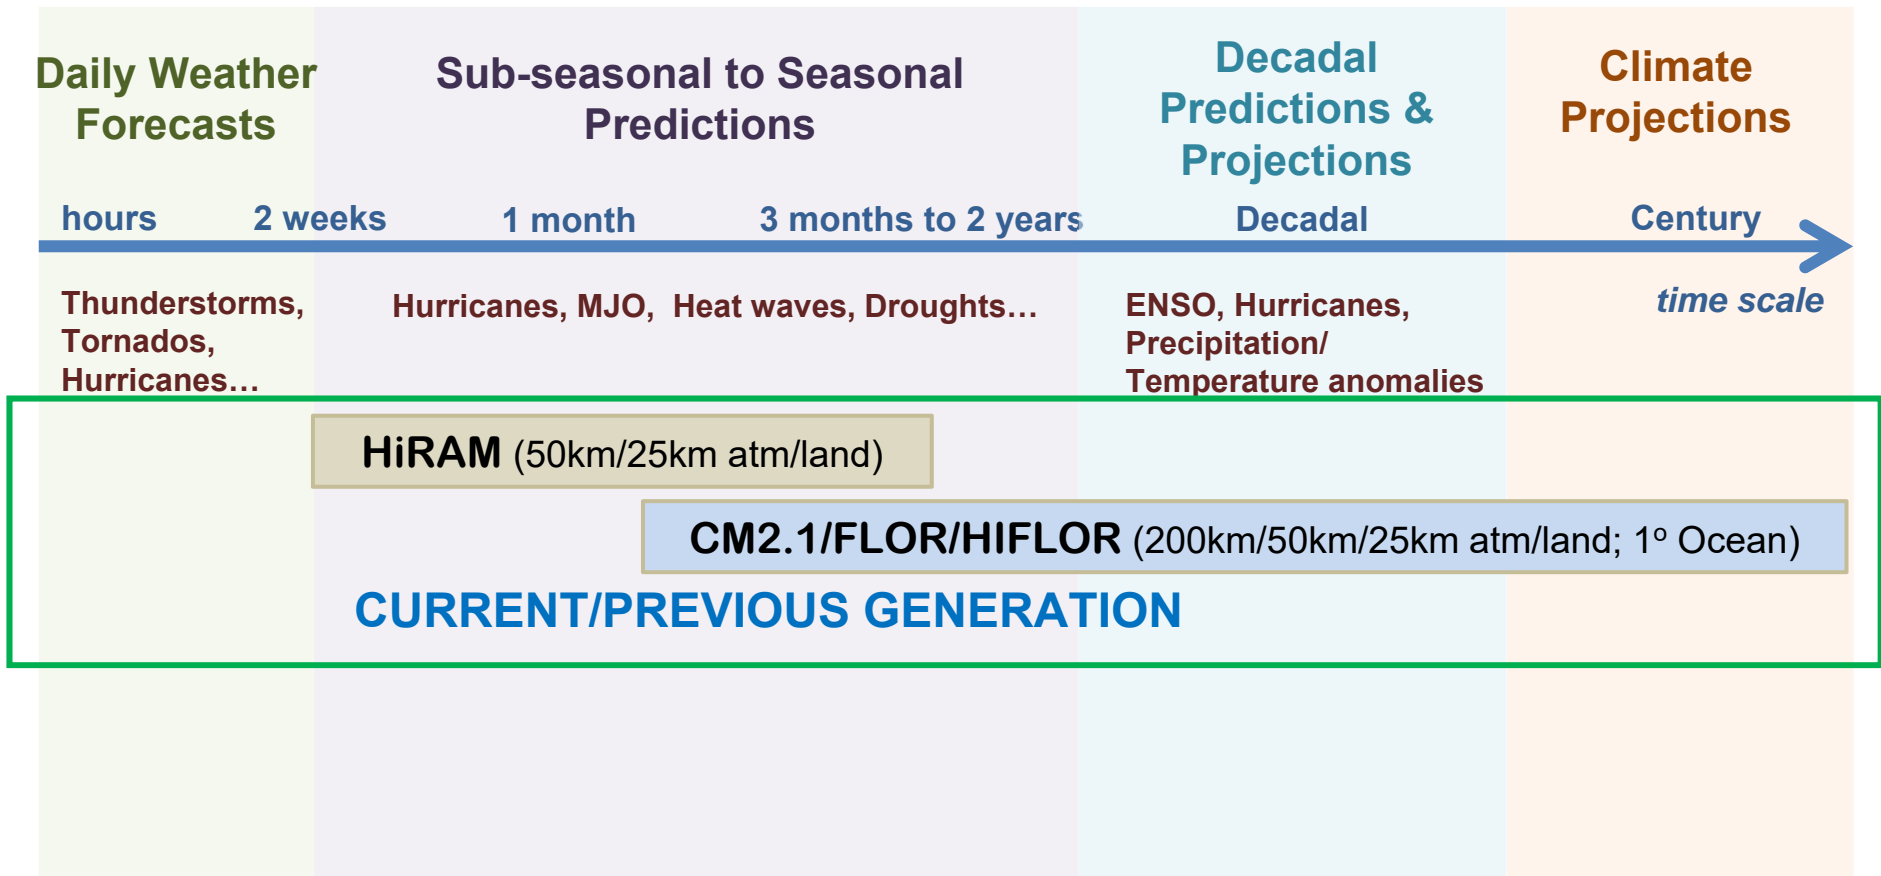

# What do we mean by “seamless” prediction and projection?

A ***unified set of modeling tools*** that can make predictions and projections across synoptic to centennial scales.

# GFDL Seamless Modeling System – Predictions and Projections

MOM4, AM2,  
LM2/3, SIS

# GFDL Seamless Modeling System – Predictions and Projections

	Atmosphere resolution	Ocean resolution
<b>CM2.1</b>	200 km	1°
<b>FLOR</b>	50 km	1°
<b>HIFLOR</b>	25 km	1°

→ Seasonal to decadal predictions and climate change projections

- CM2.1 and FLOR: North American Multi-Model Ensemble (NMME)
- Output provided to NCEP to inform their seasonal outlooks
  - FLOR and HIFLOR for **hurricanes**
  - CM2.1 and FLOR for other climate outlooks, including **ENSO, precipitation and temperature**
- Seasonal **sea ice predictions** provided routinely (Sea Ice Prediction Network, NSF)
- Ocean reanalysis provided to NCEP for Multiple **Ocean Reanalysis** Project
- **Decadal predictions** as part of international coordinated program through UK Met Office

# GFDL Seamless Modeling System – Predictions and Projections

# SPEAR: Seamless system for Prediction and Earth system Research

→ Using latest generation component models:

**AM4** (atmosphere), **MOM6** (ocean), **SIS2** (sea ice), **LM4** (land)

	Atmosphere resolution	Ocean resolution
<b>SPEAR_LO</b>	100 km	1°
<b>SPEAR_MED</b>	50 km	1°
<b>SPEAR_HI</b>	25 km	1°

*Global scale climate, decadal prediction*

*Regional hydroclimate and extremes, seasonal prediction*

*Major hurricanes, seasonal prediction*

## Future plans:

- Higher resolution atmosphere with refined mesh over North America (SHIELD)
- Higher resolution ocean, especially for coastal processes
- Incorporating Earth System Model components (biogeochemistry, carbon, marine ecosystems)

# New initialization system

New initialization systems using latest model components.

- a) New Ensemble Coupled Data Assimilation system using MOM6 (Feiyu Lu)
- b) Atmospheric initialization (see poster by Liwei Jia)
- c) Innovative sea level pressure (SLP) based assimilation system for initialization of decadal predictions (see poster by Xiaosong Yang)

Very encouraging results to date!

➔ Anticipate that SPEAR based prediction system will join the NMME in 2020

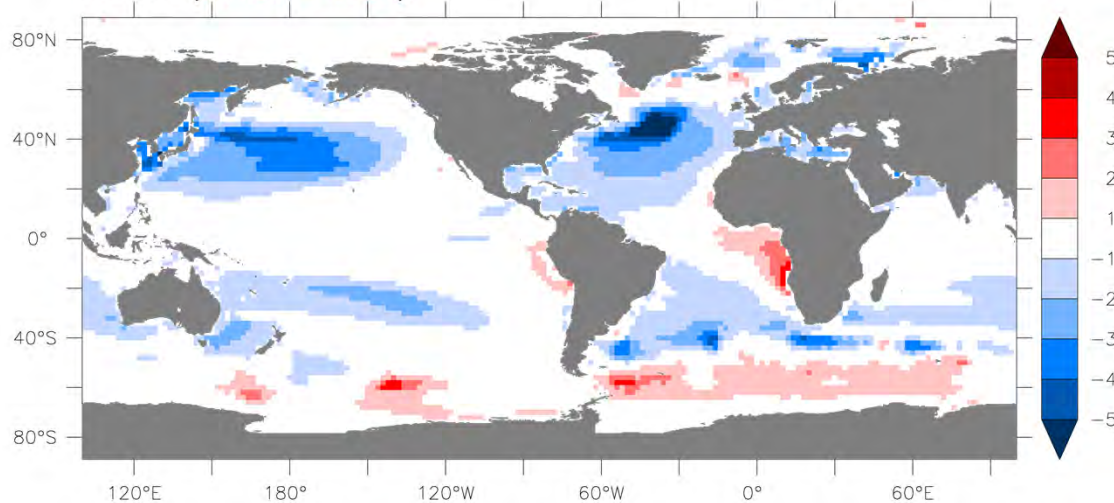

# SPEAR model performance

## SST BIAS (MODEL – OBS)

FLOR (*rmse* = 1.36)

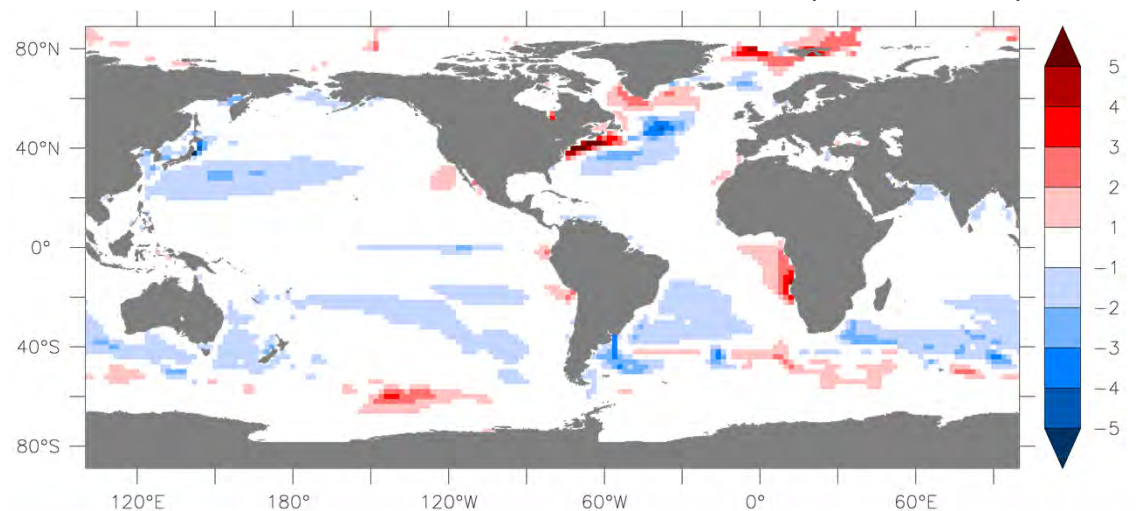

**35% reduction in SST error  
(FLOR → SPEAR)**

- Improvements from AM4
- MOM6, including hybrid coordinates

Also improvement in simulation of  
precipitation, tropical storms

SPEAR (*rmse* = 0.89)

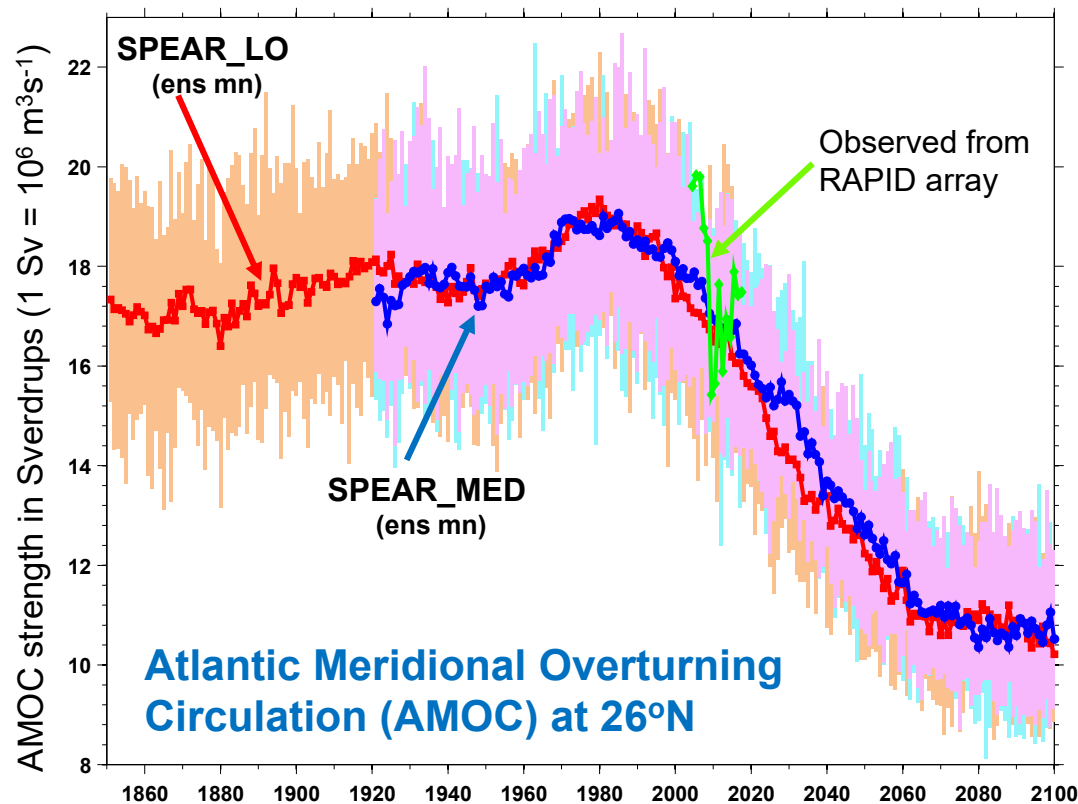

*Delworth et al, JAMES, submitted*

# SPEAR Large Ensembles

As part of seamless system, same model used for seasonal prediction is used to generate 30-member ensembles of projections for 1851-2100.

- 1851-2010: Use observed atmospheric composition
- 2011-2100: Use projected atmospheric composition from SSP5-85

*30-member ensembles using both SPEAR\_LO (100 km atmosphere) and SPEAR\_MED (50 km atmosphere)*

*Observations from RAPID array fall within model spread.*

### New studies with SPEAR ensembles:

- *Extreme rainfall and flooding over NE US*
- *“Day Zero” events in South Africa*
- *plus many others ...*

# Preview of what is to come in this session

1. Short time-scale weather and SHiELD (*Jan-Huey Chen*)
2. Subseasonal predictability (*Baoqiang Xiang*)
3. GFDL and the North American MultiModel Ensemble (NMME) (*Nat Johnson*)
4. Hydroclimate variability, predictability and extremes (*Sarah Kapnick*)
5. Tropical cyclone prediction and attribution (*Hiro Murakami*)
6. Ocean data assimilation and applications for next generation systems (*Feiyu Lu*)
  
7. Sea ice predictability (*Mitch Bushuk*)
8. Marine ecosystem prediction (*Charles Stock*)
9. Decadal variability and predictability (*Liping Zhang*)
10. Ocean heat uptake (*John Krasting*)
11. Regional climate change and fisheries (*Vincent Saba*)

# Summary

- GFDL has developed a next generation research system for seamless prediction and projection (SHiELD and SPEAR)
  - *Synoptic to seasonal to decadal to centennial*
- Leading edge GFDL developments are at the heart of this system
  - *FV3, refined mesh, AM4, MOM6, new assimilation, LM4, SIS2*
- Further development is planned to incorporate atmospheric refined mesh, higher resolution ocean, and Earth System Components
- Powerful tool for attribution analysis
